

REQUIREMENT ANALYSIS

Skill Wallet — Salesforce CRM Application

The project planning document translates CRM requirements into planned activities, user stories, priorities and sprint work. This section uses only the supplied project plan.

1. Requirement Scope

Area	Requirement represented in the project plan	Priority
Environment	Create a Salesforce Developer environment and prepare the project workspace.	High
Data management	Create Customer, Employer and Enterprise objects for systematic business data management.	High
Navigation	Create separate tabs for each object and a dedicated Lightning App.	High
Sales & billing data	Create customer and order fields to capture sales and billing details accurately.	Medium
Record presentation	Customize page layouts for different record types and relevant data-entry needs.	High
Business categories	Create separate Retail and Enterprise record types for business categories.	Medium
Data quality	Validate customer details and order inputs to prevent incorrect data entries.	High
Automation	Create automated flows for email notifications, updates and offers.	High
Billing	Automatically calculate billing amounts so invoices require less manual effort.	High
Analytics	Create sales and customer reports and visual dashboards for monitoring and analysis.	High / Medium

2. Requirement Characteristics

Incremental delivery	Functionality was organized into manageable sprints.
Data consistency	Fields, relationships, picklists and validation rules were planned before automation.
User-focused design	Layouts, record types and navigation were aligned with different CRM users.
Continuous review	Sprint reviews and testing were used to identify and resolve issues early.

REQUIREMENT ANALYSIS

Product Backlog — Environment & Data Modeling

The backlog translates project requirements into user stories. Story points indicate relative effort, while priority identifies the order in which work should be addressed.

3. Backlog — Sprint 1 & Sprint 2

USN	User story / task	Sprint	Points	Priority	Owner
USN-1	Create a Salesforce developer account to configure and deploy the CRM application.	1	1	High	Member 1
USN-2	Create Customer, Employer and Enterprise objects for systematic business data management.	1	3	High	Member 2
USN-3	Create separate tabs for each object for easier CRM navigation.	2	3	High	Member 3
USN-4	Create a dedicated Lightning App so CRM operations are accessible from one place.	2	3	High	Member 4
USN-5	Create customer and order fields to capture sales and billing details accurately.	2	5	Medium	Member 1
USN-6	Customize page layouts for different record types and relevant data-entry needs.	2	5	High	Member 2
USN-7	Create separate Retail and Enterprise record types for business categories.	2	5	Medium	Member 3

4. Data-Related Requirements

The project plan places environment setup and data modeling before later configuration, automation and analytics activities. Customer, Employer and Enterprise objects form the planned business data structure, while fields, tabs, page layouts and record types support systematic management and navigation.

Objects	Customer, Employer and Enterprise.
Navigation	Separate tabs for each object and a dedicated Lightning App.
Fields	Customer and order fields for sales and billing details.
Layouts	Customized for different record types and relevant data-entry needs.
Record types	Separate Retail and Enterprise categories.

REQUIREMENT ANALYSIS

Product Backlog — Quality, Automation & Analytics

The remaining user stories address validation, automated processes, billing, reports and dashboards.

5. Backlog — Sprint 3 to Sprint 6

USN	User story / task	Sprint	Points	Priority	Owner
USN-8	Validate customer details and order inputs to prevent incorrect data entries.	3	3	High	Member 4
USN-9	Create automated flows for email notifications, updates and offers.	3	5	High	Member 1
USN-10	Automatically calculate billing amounts so invoices require less manual effort.	4	5	High	Member 2
USN-11	Create sales and customer reports for business-performance monitoring.	5	4	High	Member 3
USN-12	Create visual dashboards to analyze sales, customers and enterprise performance.	6	4	Medium	Member 4

6. Requirement Flow

SETUP	Developer environment
DATA MODEL	Customer • Employer • Enterprise objects
CONFIGURATION	Tabs • Lightning App • Fields • Layouts • Record types
QUALITY	Validation rules
AUTOMATION	Flows • Notifications • Billing
ANALYTICS	Reports • Dashboards

Backlog Structure

The backlog moves from environment setup and data modeling toward automation and analytics. This sequence reduces dependency issues because reporting and dashboards are built after the underlying CRM data and processes are established.

REQUIREMENT ANALYSIS

Requirement Planning & Expected Outcome

The planning phase converts CRM requirements into an organized development roadmap. It establishes what needs to be built, who owns each user story, how much effort is expected, and when each increment is scheduled.

7. Planning Principles

Incremental delivery	Functionality was organized into manageable sprints.
Data consistency	Fields, relationships, picklists and validation rules were planned before automation.
User-focused design	Layouts, record types and navigation were aligned with different CRM users.
Continuous review	Sprint reviews and testing were used to identify and resolve issues early.

8. Key Requirement Deliverables

01	Salesforce development environment
02	Customer, Employer and Enterprise data model
03	Custom tabs, Lightning App, fields and relationships
04	Page layouts, record types and global picklists
05	Validation rules, email templates and automated flows
06	Reports and dashboards for CRM analysis

9. Planned Outcome

A scalable Salesforce CRM environment capable of managing customer, employer and enterprise information while supporting orders, billing, automated communication, reporting and dashboard-based analysis.

10. Requirement-to-Delivery Connection

Functional needs are converted into user stories and measurable tasks; work is grouped into sprints with planned start and end dates; each story is assigned to a team member for accountability; and testing and sprint reviews are included throughout development.
